

IDOL EVENT ADVENTURE GAME

INTRODUCTION

This is a 2D adventure game set around an idol event and concert. Players explore the event venue, interact with different booths and characters, complete tasks, take part in voting, and earn points through a queue mini-game before finally reaching an aerial concert at the top of a skyscraper.

The project combines environmental exploration, character interaction, and mini-game mechanics. Its light and colorful visual style is intended to create a lively and immersive idol-event experience.

Core Gameplay

Main Scene – “Event”

1. Stay In Line Entrance — Enter this area and press W or Up to begin the queue mini-game.
2. Queue Guide NPC — Helps the player identify the mini-game entrance.
3. Collectible Coins — Reward exploration and increase the player’s saved score.
4. Mission Board — A dedicated landmark for mission-related activities.
5. Drink Shop — Connects the main hub to the mini-game’s drink mechanic.
6. Central Fountain — The main visual and navigational landmark of the plaza.
7. Score Submission — Converts collected points into progress toward the level goal.

Stay In Line Mini Game

Editing the spline directly in the editor makes level design quick and easy.

Built an editor-friendly path decoration system for the Stay In Line level. A Line2D acts as the designer-editable spline, while a custom @tool SplineTextureSpawner automatically samples points along that line and places repeated atlas sprites at consistent spacing. This lets the level path be shaped directly in the Godot editor, with the stone path visuals regenerating immediately as the line is edited.

The system supports configurable atlas texture, atlas regions, sprite spacing, sprite scale, path offset, and optional rotation along the path. It also falls back to sampling a Path2D curve when no Line2D source is available, making it usable for both hand-authored editor paths and curve-based gameplay paths.

The green area represents the safe zone. Leaving it results in a game over.
